"Obtaining Natural Lignin From Wood by Destructive
Distillation," M. I. Chudakov, Far Eastern Bas-
tmen V. I. Komarov, Acad Sci USSR, 32 pp

"Dok Ak Nauk SSSR" Vol LXII, No 6

Methanol was found the most effective solvent for
extracting lignin. Process lasted 24 hours at boil-
ing point of alcohol. After filtration and washing,
lignin was isolated in the form of a cream-colored
powder. Data indicates absence of carbonyl group-
ing in lignin molecules or light dismutation

Preparation of natural lignin from destructively decomposed wood pulp. M.I. Chudakov. Doklady Akad. Nauk S.S.R.R. 63, 783-786 (1954). Wood pulp from *Pinus koraiensis* infected with *Perisporium* was the starting material. The destroyed wood matter contains products of decompn. of lignin as well as those of cellulose. Extnd. with water serves to remove a considerable amt. of reducing substances (up to 97%) and the residual lignin complex is attacked by atm. O₂ with humin formation on the exposed surfaces, giving products capable of forming colloidal solns. in water. The natural lignin can be sepd.

by the following procedure: the dried matter is extnd. by 1:1 EtOH-benzene mixt. in the cold by percolation for 10 days, the residue is heated 16 hrs. at 100° with water to remove water-sol. matter, and humic acids are extnd. by excess 5% NaHCO₃ at 100° (24 hrs.); the residue is extnd. (24 hrs.) with MeOH and the concd. ext. is poured into water; lignin ppts. as a creamy solid; about 20% of the total lignin was thus extnd. The sepn. according to MeO content was done with MeOH, 24 hrs. at 0°, 10 hrs. at 90°, and four 10-hr. extns. at 90° in autoclave; this showed that 15-20% of natural lignin suffers a loss of up to 3% of its MeO content by the fungus attack. The last fraction (11.6% MeO) was similar to genuine lignin and was ppts. by CO₂ from dil. NaOH. Acid extn. of lignin gives lowered MeO content through hydrolysis. Exhaustive methylation by Me₂SO₄ gave products with 18.5% MeO; acetylation gave 21.4% Ac. The empirical formula is C₁₁H₁₀O₇, with 3 MeO and 4 OH groups.

"Natural Lignin Free Lumber Which Has Been Deter-
minatively Decapitated," M. I. Chudakov, Inst. of
Forest Sci. Res. Inst. for Appl. Sci. USSR, 7/3/47

"Lignin Praktikum" Vol. III, No 4

Representation processes and the activity of specific
enzymes break down the bonds between lignin and
other fungi break down the bonds between lignin and
other carbohydrate components in wood. Lignin compounds
are decomposed on the surface, giving off phenoxyl
radicals which are subsequently oxidized into quinones.
These, which are subsequently oxidized into quinones,
give rise to various products. Fractional extraction by organic
solvents gives a considerable yield of natural lignin.
Fractional extraction by acidic solvents gives a
higher yield of lignin, giving up to 70% neutral lignin. The
phenol content of wood is determined by a colorimetric
method based on the formation of a complex between
phenol and ferric ions. Empirical formulas for the
phenol content of wood include those
for the former type include those
for the latter and some hydroxyl groups. Submitted
8/31/48.

Title: New Method of Cooking Control

Original

Periodical: Gidroliznaya i lesokhim. prom-st', 1955, No 2, 19

Abstract: A new method is proposed for control of discharge of hydrolyzate (I) with the withdrawal of varying volume of I. In the last portions of discharge I concentration of reducing substances (RS) is determined by rapid refractometric method. Percolation is discontinued at a concentration RS < 1.5%. Withdrawal of varying amounts of I made it possible to decrease duration of percolation on the average by 28 minutes and the volume of hydrolyzate obtained per cooking by 3.2 m³. Average yield of RS per cooking has been decreased from 1.99 to 1.97 t but the sugar concentration of I increased from 3.09 to 3.22% and

✓ Stabilization of gypsum solution with dextrose. M. I. Chudakov, K. P. Vakhritscheva, and L. V. Lebedeva (IVG "Gidrolyz Plant, Kausk). *Gidrolyz i Lesokhim. Prom.*, 5, No. 4, 20-1 (1955). Factors affecting the formation of supersatd. solns. of CaSO_4 in neutralization of H_2SO_4 hydrolysates (I) are: temp., the rate of growth of crystal nuclei, the amt. of ptd. CaSO_4 , the intensity of agitation, and the presence of colloidal org. compds. At 75-80° $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ is formed predominantly; higher temp. leads to the formation of $\text{CaSO}_4 \cdot 1/2\text{H}_2\text{O}$ which, on cooling to 28-30°, gives supersatd. soln. The beneficial effect on the prevention of CaSO_4 deposits on fermentation equipment, experienced [in filtering partially neutralized solns. through sawdust], has motivated the study of the influence of cellulose sugars (II) on CaSO_4 solns. Boiling the soln. (pH 4.1-4.2), taken from a sedimentation tank, with sawdust showed that these solns. contained more sol. CaSO_4 than untreated. In another expt., sawdust was treated with 72% H_2SO_4 , the amt. of fermentable sugars dtd., and the substrate added to I. The amt. of sol. CaSO_4 in I was almost twice as high as in the soln. without II. Neutralizing I with a mixt. of CaO and MgO led to a higher content of sulfate in the soin. as a result of the higher solv. of MgSO_4 . T. Jurecic

Title: Production of Active Hydrolysis Lignin for the Rubber Industry

Original

Periodical: Gidroliznaya i lesokhim. prom-st', 1956, No 3, 13-14

Abstract: Maximum yield of activated lignin with least expenditure of alkali can be attained on using NaOH in an amount of 30% of the amount of initial lignin and carrying out the cooking at 180° for 4 hours. On decrease of the modulus from 10 to 6.2 and the amount of NaOH from 40 to 25% of the weight of hydrolysis lignin the yield of activated lignin decreases slightly and its concentration in the solution increases from 7 to 11%. At the same time concentration of the residual free NaOH decreases by more than 2 times, and its expenditure per one kg of activated lignin to 0.33-0.35 kg.

Chudakov, M.I.

Alkaline activation of hydrolytic lignin. S. I. Sykhanovskii and M. I. Chudakov. *Zhur. Priklad. Khim.* 29, 410-15 (1956). — The max. solv. (I) of lignin heated with aq. NaOH soln. is a function of the temp. and the percentage of NaOH (lignin basis). I at 160, 180, and 200° was 80.6, 90.4, and 98.2% with 120, 60, and 60% NaOH. The corresponding values of "lignin acid" (II) (pptd. with dil. H₂SO₄) were 63.0, 74.0, and 64.4% (sol. lignin basis). Activation at lower temps., 90-100°, in a current of CO₂-free air for 50 hrs. failed to increase I above 50% (cf. Nikitin, *Gidroiz. Prom.* 3, 3(1954)). At 200°, 25-30% of the MeO groups were lost and the proportion of OH groups increased by 10.2%. The insol. portion contained 25.1% ash. The soins, thus obtained contained 8-9% lignin. To reduce the bulk the following methods of dry activation were tried: (a) the lignin was ground with NaOH in the wet, dried at 105°, and heated at 180° for 1-3 hrs. I of 47.8, 65.2, 62.1, and 73.8% were obtained with 25%, NaOH in 3 hrs., with 30% NaOH in 2 hrs., and with 35 and 40% NaOH in 1 hr. The corresponding values of II (not the max.) were 34.2, 38.6, 38.6, and 28.5%; (b) the dried mixt. of lignin and NaOH as in a was heated 3 hrs. at 200° in petrolatum (m. 45-50°). I increased from 75.3 to 97.2% as the NaOH proportion increased from 40 to 100%. The corresponding values of II decreased from 66.0 to 45%. L. Dencowitz

Title : Preparation of Oxalic Acid from Hydrolysis Lignin.
Orig Pub : Zh. prikl. khimii, 1957, No 5, 802-806

Abstract : It is shown sulfuric acid hydrolysate and hydrochloric acid lignin (L) can be produced 35 and 49%, respectively, of oxalic acid (I), by means of an oxidation of the L with HNO_3 , specific gravity 1.38. The reaction is conducted with care: L is added into the acid in small increments, the reaction mixture is kept under observation until the exothermic reaction is completed (cooling of the reaction vessel with cold water or ice). The crystallization is carried out in two steps (I and II).

TITLE: On the Benzoid Structure of Hydrolytic Lignin (O benzoidnoy strukture gidroliznogo lignina)

PERIODICAL: Zhurnal prikladnoy khimii, 1959, Vol XXXII, Nr 3, pp 608-613
(USSR)

ABSTRACT: The changes of the structure of technical lignins occurring during chemical and technical treatment are investigated here. Hydrolytic lignin gives 2.4% of benzenopolycarboxylic acids on oxidation. It has a benzoid structure which may be represented by five benzene rings connected by -C-C-bonds. The alkaline activation of hydrolytic benzene in aqueous solution at 180°C produces ligninic acids, in which the benzoid structures comprise 8%. These acids give 25.2% of polycarboxylic acids when oxidized, among them also mellitic acid. They are completely soluble in alkali and organic solvents. The carbon substance in lignin is arranged in a regular order by alkaline activation. It is characterized by the condensation of carbon into plane hexagonal lattices.

TITLE:

Activated alkaline hydrolysis lignine as an active filler for synthetic rubber

PERIODICAL:

Referativnyy zhurnal. Khimiya, no. 4, 1963, 650, abstract 4T366 (Khim. pererabotka drevesiny. Nauchno-tekhn. sb., no. 4, 1962, 25 - 36)

TEXT: To activate lignine produced by hydrolysis it is boiled in the hydrolysis apparatus in an alkali solution the ratio of alkali to lignine 0.4:1 and the temperature 180 - 200°C, for 6 - 8 h. 90 - 95 % of the lignine passes into solution. A mixture of 25 % CKMC-30 (SKMS-30) latex, an alkaline solution of lignin (19.5 % "ligninic acids", i.e. lignine separated out of solution during acidification) and avtol 18, 15 parts by weight of oil and 20 parts by weight of lignine to the rubber at pH 10 and 40°, is mixed in a 10 % solution of CH_3COOH and water at 60°C. The mixture is poured into a coagulating solution of CaCl_2 . The suspension obtained is passed to a strip-casting machine for washing. Strip is not, however,

Card 1/2

S/081/63/000/004/051/051
B156/B180

Activated alkaline hydrolysis is formed and the mixture is dried in friable form, in a special drier. The consumptions per ton of the lignin-and-oil-filled rubber are 46 kg of CaCl_2 , 47 kg of CH_3COOH , and 7 tons of water. With a single volumetric filling, the SKMS-30 vulcanizes containing lignin or gas channel black have almost identical physical and mechanical properties. At the Krasnoyarsk hydrolysis works it has been found economically possible to produce activated alkaline lignin for use at the Krasnoyarsk synthetic rubber works. A ton of dry commercial lignin costs 170 rubles.

TITLE: Obtaining quinonic nitropoly carboxylic acids -- plant growth stimulants

SOURCE: AN SSSR. Doklady, v. 164, no. 3, 1965, 598-601

TOPIC TAGS: hydrolysis, plant growth, organic nitro compound, molecular weight, quinone, chemical reactor, polysaccharide, solvent extraction, chemical precipitation, polycarboxylic acid, biochemistry, oxidation.

ABSTRACT: The authors have developed and applied a method of fractional, gradual oxidation and hydrolysis of condensed lignin with nitric acid in an aqueous medium at 100°. The gradual introduction of the oxidant in the reaction mixture leads to a minimum breakdown in the quinonic acids formed and permits the process to be carried out for a small consumption of oxidant. As the object of the investigation, different kinds of technical lignins subjected to prolonged condensation treatment were used. Lignin (lignin content, according to Koenig, was 85 - 90%, OCH₃ -- 4.7 - 5%) in the amount of 500 grams in 5 liters of water -- was placed into a stainless steel reactor fitted with cooling coils, a reflux condenser, a mixer, and an electric heating attachment. The suspension of lignin in water was heated to 100°. After the mixer had stirred the mixture gradually

for six hours, nitric acid (1.35) was added in the amount of 0.75 kg (based on the calculation for the monohydrate), with a gradual supply of heated air into the lower part of the reactor. The reaction proceeded vigorously with the evolution of gaseous products and in some cases required cooling. At the completion of the reaction, the solution containing only traces of nitric acid was filtered free of the insoluble residue and was neutralized with calcium carbonate to pH 2.8 - 3. In order to isolate the quinonic acids, the solution was further extracted with methylethylketone. The extract was dried with sodium sulfate. After separation of a larger part of the solvent in vacuum, a thick syrup was poured into dry petroleum ether. The precipitating dark-red oil was separated from the other, dried in a vacuum drier at 40° and in a vacuum dessicator over alkali, and then over phosphoric anhydride for a period of a week. The yield was up to 30% of the lignin weight used. The resulting brick-red, very hygroscopic powder dissolved readily in water and in polar organic solvents.

In investigating its properties, the fraction dissolved when heated in dioxane was used. The product was titrated potentiometrically in an aqueous solution as a strong acid. Its molecular weight (cryoscopically determined) in dioxane was 286. The gram-equivalent was 132. The content of carboxylic groups in the molecule is approximately two. Elemental composition (in %) was as follows: C -- 45.1, H -- 3.74, O -- 45.84, and N -- 5.32.

Upon comparison of experimental and calculated data (elemental composition, molecular weight, gram-equivalent, and infrared spectra), it is assumed that the products obtained by the authors can be classed as quinonic nitropolycarboxylic acids. This paper was presented by Academician A. L. Kursanov on 23 November 1964. Orig. art. has 2 figures. [PRS] SUB CODE: 07, 06 / SUB DATE: 19Nov64 / ORIG REF: 006 / OTH REF: 006 Card 212 30

Cudakov, N. G., and Pavlyuk, A. K. On summation functions of characters of numerical groups with a finite basis. Trudy Mat. Inst. Steklov., v. 38, pp. 366-381. Izdat. Akad. Nauk SSSR, Moscow, 1951. (Russian) 20 rubles.

Suppose \mathbb{G} is a multiplicative group of positive algebraic numbers with a finite basis $\omega_1, \omega_2, \dots, \omega_p$, where we assume $\omega_k > 1$ for $k = 1, 2, \dots, p$. Let \mathbb{S} be the semigroup generated by $\omega_1, \omega_2, \dots, \omega_p$. Suppose χ is a (not necessarily bounded) character of \mathbb{G} , that is a homomorphism of \mathbb{G} into the multiplicative group of non-zero complex numbers. Let H be the function defined on the non-negative real numbers by the formula $H(x) = \sum_{a \in \mathbb{S}, a \leq x} \chi(a)$. Suppose $\sigma_0 = \max_{1 \leq k \leq p} (\log |\chi(\omega_k)|)/(\log \omega_k)$ and q is the number of values of k for which $\sigma_0 = (\log |\chi(\omega_k)|)/(\log \omega_k)$. Then the authors prove the following assertions about the behavior of $H(x)$ as $x \rightarrow \infty$. (1) If $\sigma_0 < 0$, then $H(x)$ is bounded. (2) If $\sigma_0 = 0$, $q = 1$, and $\chi(\omega_k) \neq 1$ for all k , then $H(x)$ is bounded. (3) If $\sigma_0 = 0$ and $\chi(\omega_k) = 1$ for some k , then $H(x) = \Omega(x)$. (4) If $\sigma_0 = 0$ and $q \geq 2$, then $H(x) = \Omega((\log \log \log x)^4)$. (5) If $\sigma_0 > 0$, then $H(x) = \Omega(x^{\sigma_0})$. Although (1) and (2) are almost trivial, the proofs of (3), (4), and (5) require delicate methods from analytic number theory due to Vinogradov, Gelfond, and Linnik. A particular case of the above is a result of Cudakov and Linnik [Doklady Akad. Nauk SSSR (N.S.) 74, 193-196 (1950); these Rev. 12, 393] to the effect that if \mathbb{G} is a multiplicative subgroup of the positive rationals generated by a finite set \mathfrak{P} of prime numbers and if χ is a bounded character of \mathbb{G} , then $H(x)$ is bounded if and only if \mathfrak{P} contains exactly one prime number and χ is not the principal character of \mathbb{G} .

LL

Čudakov, N. G. On a class of completely multiplicative functions. Uspehi Matem. Nauk (N.S.) 8, no. 3(55), 149-150 (1953). (Russian)

Suppose t is a non-zero real number and χ is a non-principal residue-character, and let h be the function defined on the positive integers by the equality $h(n) = \chi(n)n^t$. The author proves that h is not a residue-character but nevertheless shares with residue-characters the property that $\sum_{n=1}^{\infty} h(n)$ is bounded. In the terminology of earlier papers [Čudakov and Rodoskiĭ, Doklady Akad. Nauk SSSR (N.S.) 73, 1137-1139 (1950); these Rev. 12, 393; Čudakov and Linnik, ibid. 74, 193-196 (1950); these Rev. 12, 393; Kubilius and Linnik, Trudy Mat. Inst. Steklov. 38, 170-172 (1951); these Rev. 15, 103], this shows that the function h is a generalized character which is not a residue-character and which has an infinite basis. It is unknown whether or not there exist other generalized characters with these two properties. P. T. Bateman (Urbana, Ill.).

"Characters of Numerical Subgroups With Sufficiently Sparse Basis," B. M. Bredikhin

DAN SSSR, Vol 90, No 5, pp 707-710

Generalizes results for summatory functions of characters of numerical subgroups with finite basis (see N. G. Chudakov and A. K. Pavlyuchuk, Trudy Matemat In-ta imeni Steklova, 38, 366 (1951)) for the case of an infinite sufficiently sparse basis. Author's aim is to demonstrate the following theorem: if one of the normed characters is

260T78

$X(w_k) = 1$ and the finite number $\pi(x)$ of basic numbers of subgroup G is given by $\pi(x) = O(\lg x)$, then the summatory function $H(x)$ of character $X(a)$ is given by $H(x) = O(x^m)$ ($0 < m < 1$). Acknowledges advice of Prof N. G. Chudakov. Presented by I. M. Vinogradov

TRANSLATION: Let Z be a ring of integer rational numbers and R a ring of polyadic numbers (RZhMat 1961, 10A157). It is proved that each finite-value periodic function specified on Z can be continued over the entire ring R , this continued function being continuous everywhere; conversely, each finite-value function which is continuous on Z has an integer period on Z . It is deduced from this that any Dirichlet character is continuable on the ring R , the continued function being continuous

Card 1/2

L 58432-65

ACCESSION NR: AR5013622

and fully multiplicative; it is called the Dirichlet character of the ring \mathcal{R} . It is proved that all the original Dirichlet characters form an orthogonal family over the ring \mathcal{R} . In the conclusion, the following question of importance to the theory of characters is raised: When does the multiplicativity of a function of a variable imply its continuity? There are misprints in the text.

poluprovodnik. materialov. M., 1962, 28-35

TOPIC TAGS: birefringence, germanium crystal, crystal growing 2

TRANSLATION: By means of a PIK-1 photoelectric polariscope ($\lambda = 2.25 \text{ mm}$), the
effect of thermal conditions during Ge crystal growing upon the birefringence
patterns caused by mechanical stresses was studied. Specimens up to 40 mm diameter
were cut at right angles to the growing axis from the crystals obtained by the
Chukral'skiy-method growing and by zone melting. The birefringence distributions
were plotted in the dislocation-density distributions determined from etching patterns.
It is noted that, under industrial conditions, the method of birefringence study
requires less labor than the method of dislocation study. Bibliography: 4 titles.

Studies and Calculations of Forging (Cont.)

SOV/3718

PURPOSE: The book is intended for technical personnel and scientific workers in the metal-forming industry.

COVERAGE: This collection of 12 articles deals with current research on metal-forming operations, the design and operation of press-forging machinery, and stress and force analyses in punching and blanking operations. No personalities are mentioned. References follow each article.

TABLE OF CONTENTS:

Podrez, S. A. [Engineer]. Optimum Values for the Energy Reserve of Flywheels, Angles of Nominal Pressures, and the Number of Strokes in Single-Action Crank-Driven Presses

The author discusses GOST standards (4862-49 and 7766-55) for improved crank length and number of strokes for single- and double-crank metal-forming presses. He presents an analysis of crank angles, flywheel stresses, and power reserves in flywheels. Formulas for computing desired values and empirical data suggested as standards are given. 3

given. This method allows for spring deformation in addition to the usual allowance for load displacement.

Chudakov, P. D. [Candidate of Technical Sciences]. Calculation of Cutting Force and Work and the Layout of Graphs in the Cutting of Sheet Metal in Dies

104

The article is an analysis of cutting operations performed on stamping dies. The analysis includes stress conditions, deformation (stress-strain) characteristics, and formulas for obtaining a reliable estimate of required forces for performing cutting operations. The coefficients for punch penetration, yield point, elongation, area reduction, and tensile strength for some forty different types of metal sheets and plates are presented. The author endeavors to prove that force and power parameters in sheet-cutting operations can be established by two coefficients, tensile strength and reduction in area. New formulas are deduced to determine the force required for flat-end edges and beveled edges.

lubricant, semihot pressing

ABSTRACT: The authors briefly discuss cold and hot pressing of steels and conclude that
in some cases it may be more economical to press semihot steel. The purpose of semihot
pressing compared to cold pressing is to decrease the working pressure and to obtain
parts whose accuracy and surface would be comparable to those obtained by cold pressing.
Semihot pressing is a new and still insufficiently investigated process. It is not
widely used. Therefore, the first experiments were made on small-scale units.
The results of pressing were made during 1960-1961 at the authors' laboratory. The results
obtained are discussed in this paper. A special machine for semihot pressing is described.

A number of lubricants for semihot pressing were prepared and their effectiveness tested; their composition is given. A table shows the dependence of the values of specific pressures employed for various steels on the temperature and the degree of deformation. It is evident that a suitably chosen lubricant lowers the specific pressure appreciably in the temperature interval investigated (923-1123K). In comparison with cold pressing, a lowering of specific pressure by a factor of 2-4 was observed. It is noted that the accuracy of the dimensions of forgings obtained by semihot pressing is determined essentially by the accuracy of the die and the pressing machine. When designing a pressing machine or semihot pressing, it is necessary to allow for temperature shrinkage, which is equal to 0.008. The microstructure of the forgings obtained by semihot pressing was examined and no microcracks were detected. The satisfactory results obtained make a continuation of investigation advisable to provide a basis for practical recommendations concerning semihot pressing in industry. Orig. art. has: 6 figures and 3 tables.

TITLE: On the Investigation of the Angular Distribution of Shower Particles
in Nuclear Interactions 79

PERIODICAL: Izvestiya Akademii nauk Uzbekskoy SSR, Seriya fiziko-matemati-
cheskikh nauk, 1960, No. 3, pp. 16 - 23

TEXT: The authors join the results of (Ref. 1,2,3). Let $c\theta_0$ be the velocity
of the system of the mass center, $c\theta^*$ be the velocity of the particle in
this reference system, let $m = \frac{c}{\theta^*}$. The paper contains a theoretical in-
vestigation of the angular distribution of the shower particles for different
 $m \neq 1$. It is assumed that there exists a reference system with a symmetrical
angular distribution of the shower particles with respect to the angle
 $\theta^* = \frac{\pi}{2}$ (S - system). The system of the laboratory is called L - system.

On the Investigation of the Angular Distribution S/166/60/000/03/03/011
of Shower Particles in Nuclear Interactions C111/C222

It is stated that the deviation of the number m from the value 1 for not too large energies leads to an apparent asymmetry of the angular distribution with respect to the angle $\frac{\pi}{2}$ in an arbitrary reference system. At the other hand, here the anisotropy of the angular distribution in the S-system and the mean value M can be estimated if the weak dependence of the characteristics of the angular distribution of m in the domain of small angles θ in the L - system is used. Different methods for the estimation of M have to lead to the same results and simultaneously show whether $M > 1$ or $M < 1$. In the contrary case it can be concluded that there does not exist a reference system with an angular distribution symmetrical with respect to $\frac{\pi}{2}$. Title: Angular Distribution of Shower Particles in Nuclear Interactions Between Fast Neutrons and Heavy Nuclei of Photographic Emulsions

Periodical: Journal of Experimental and Theoretical Physics, 1960, Vol. 59, No. 4(12), pp. 1524-1539.

Text: The angular distributions of secondary particles were investigated in 70 interaction events of singly-charged or neutral cosmic particles with heavy photoemulsion nuclei. These showers were found during the evaluation of Ilford-5 plates, which had been exposed in the stratosphere in 1955. In the course of the Italian expedition, 55 of them had been caused by singly-charged, and 15 by neutral particles. The numbers of the primary particles could be determined as according to $10^{-12} \text{ cm}^2/\text{sr}$, the showers consisted of more than eight strongly ionizing particles. Symmetry investigations of the angular distributions led to the result that symmetry case 1/3

exists with respect to the angle $\pi/2$ in a system of reference, in which for half of all particles $\theta > \pi/2$ (π -system), the conversion of 9 measured in the laboratory system is carried out according to the equation $\theta_{\text{lab}} = \tan(\theta/2)$, where θ is the Lorentz factor, γ_0 is determined from $(\gamma_0)^2 - \tan^2(\theta/2) = -1$ and $\theta_0 = \tan^{-1}(\theta_0) = (\theta_0)^2 + 1/2$.

Fig. 1 shows the angular distribution in the systems for secondary shower particles, caused by charged particles a) for $\gamma_0 < 5$ (11 showers of 55), and b) for $\gamma_0 > 5$. Further, the distributions for the angular distributions were investigated along with the interrelation between γ_0 and the number of the relativistic tracks n_{rel} ($n_{\text{rel}} > 5$). The mean anisotropy of the angular distribution of the particles in the system may quantitatively be characterized by:

Case 2/3

$$\sigma = \left[\sum_{i=1}^{n_1} \left[\log \tan \theta_{1,i} - \langle \log \tan \theta_1 \rangle_1 \right]^2 / \sum_{i=1}^{n_1} (\alpha_2^{-1})_i \right]^{1/2}$$

where n_1 is the number of charged secondary particles in the 1st shower with $0 < \pi/2$, n_1 is the number of showers, α is between 0.44 and 0.55. The authors thank O. B. Zhdanov for discussions. Z. S. Saltykov is acknowledged. There are 4 figures, 1 table, and 6 references. 5 Soviet, 2 USA, and 1 Italian
